ASP.NET Core Identity

Replacement for ASP.NET Membership

Supports more types of authentication

- Cookies, OAuth2, etc.

Pluggable

- Have complete control over User Entities
- Support non-relational identities
- Even LDAP/AD stores

“Can’t I Just Use Cookie Auth for My API?”

Cookies are easiest, but least secure

Open ID, OAuth2, or JWT Tokens are best

Depends most on your security requirements, not the effort level

What We've Learned

Identity can use existing or new DbContext
Authorize attribute supports views or API
Identity Configuration gives you full control
Can use Identity anywhere user can access
